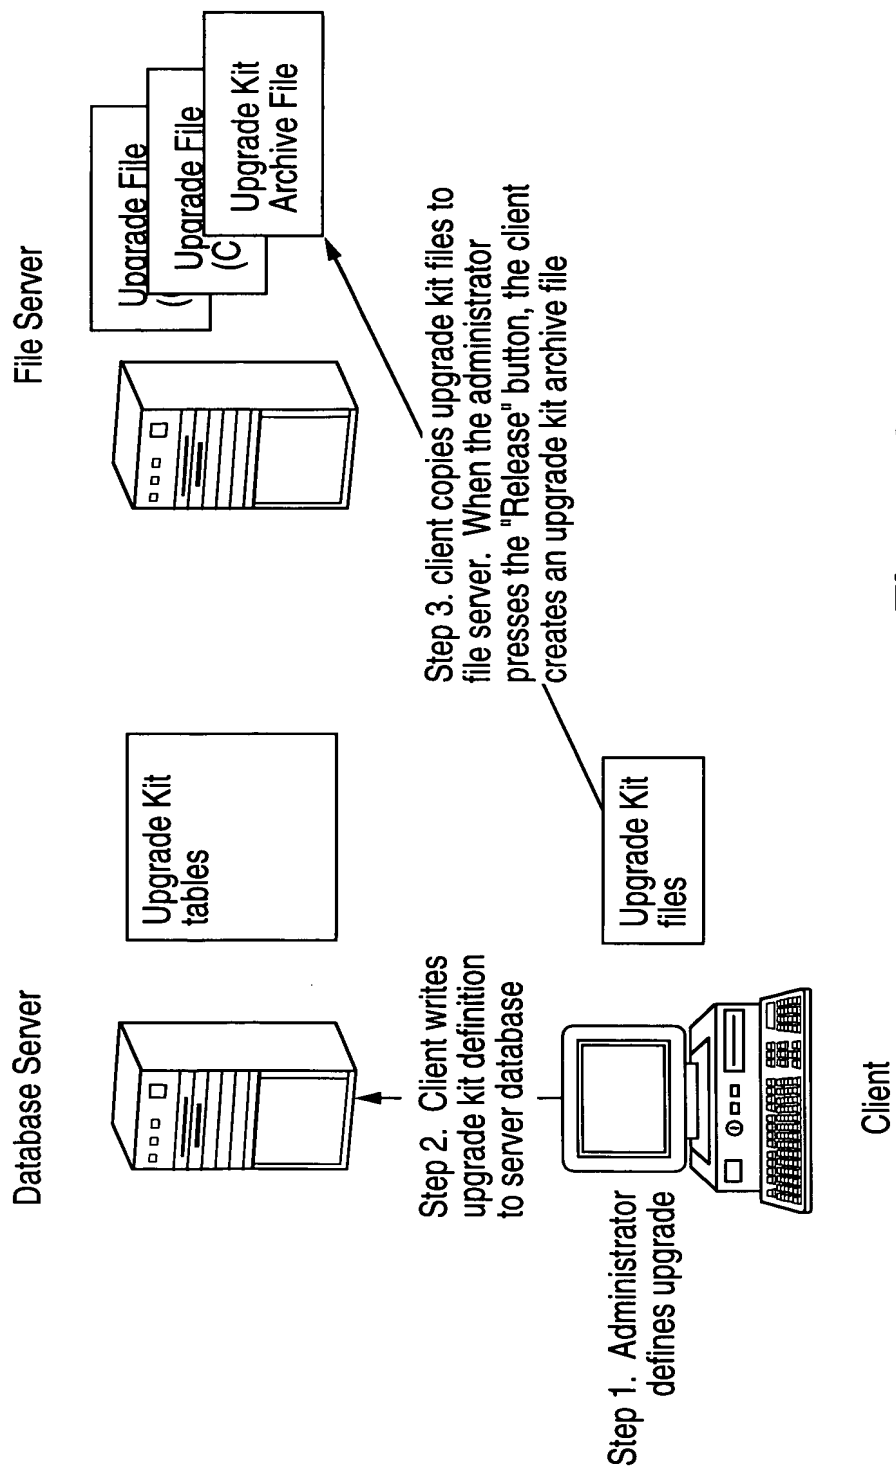

Figure 1

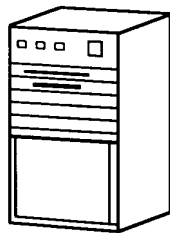

Administrator

**Figure 2**

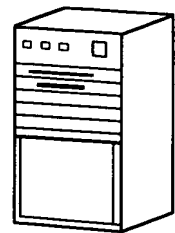

Step 1. Administrator updates the required versions for users

Database Server

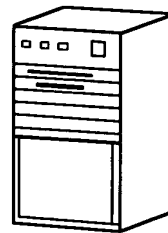

Software Component tables

Application Server

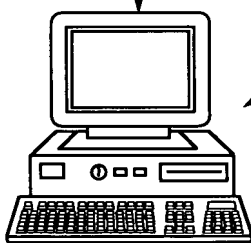

File Server

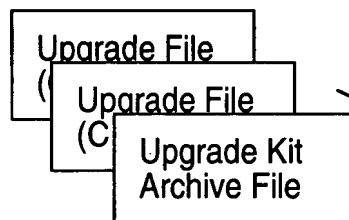

Step 2. At startup, client compares required versions to locally installed versions for each software component

Step 4. Remote routes new required versions to mobile and regional databases

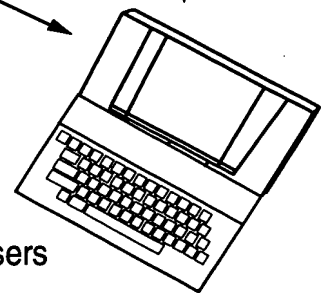

Connected User

Step 3. If an upgrade is required, the client retrieves the upgrade kit archive file from the file server and invokes the Upgrade Wizard to apply to the location

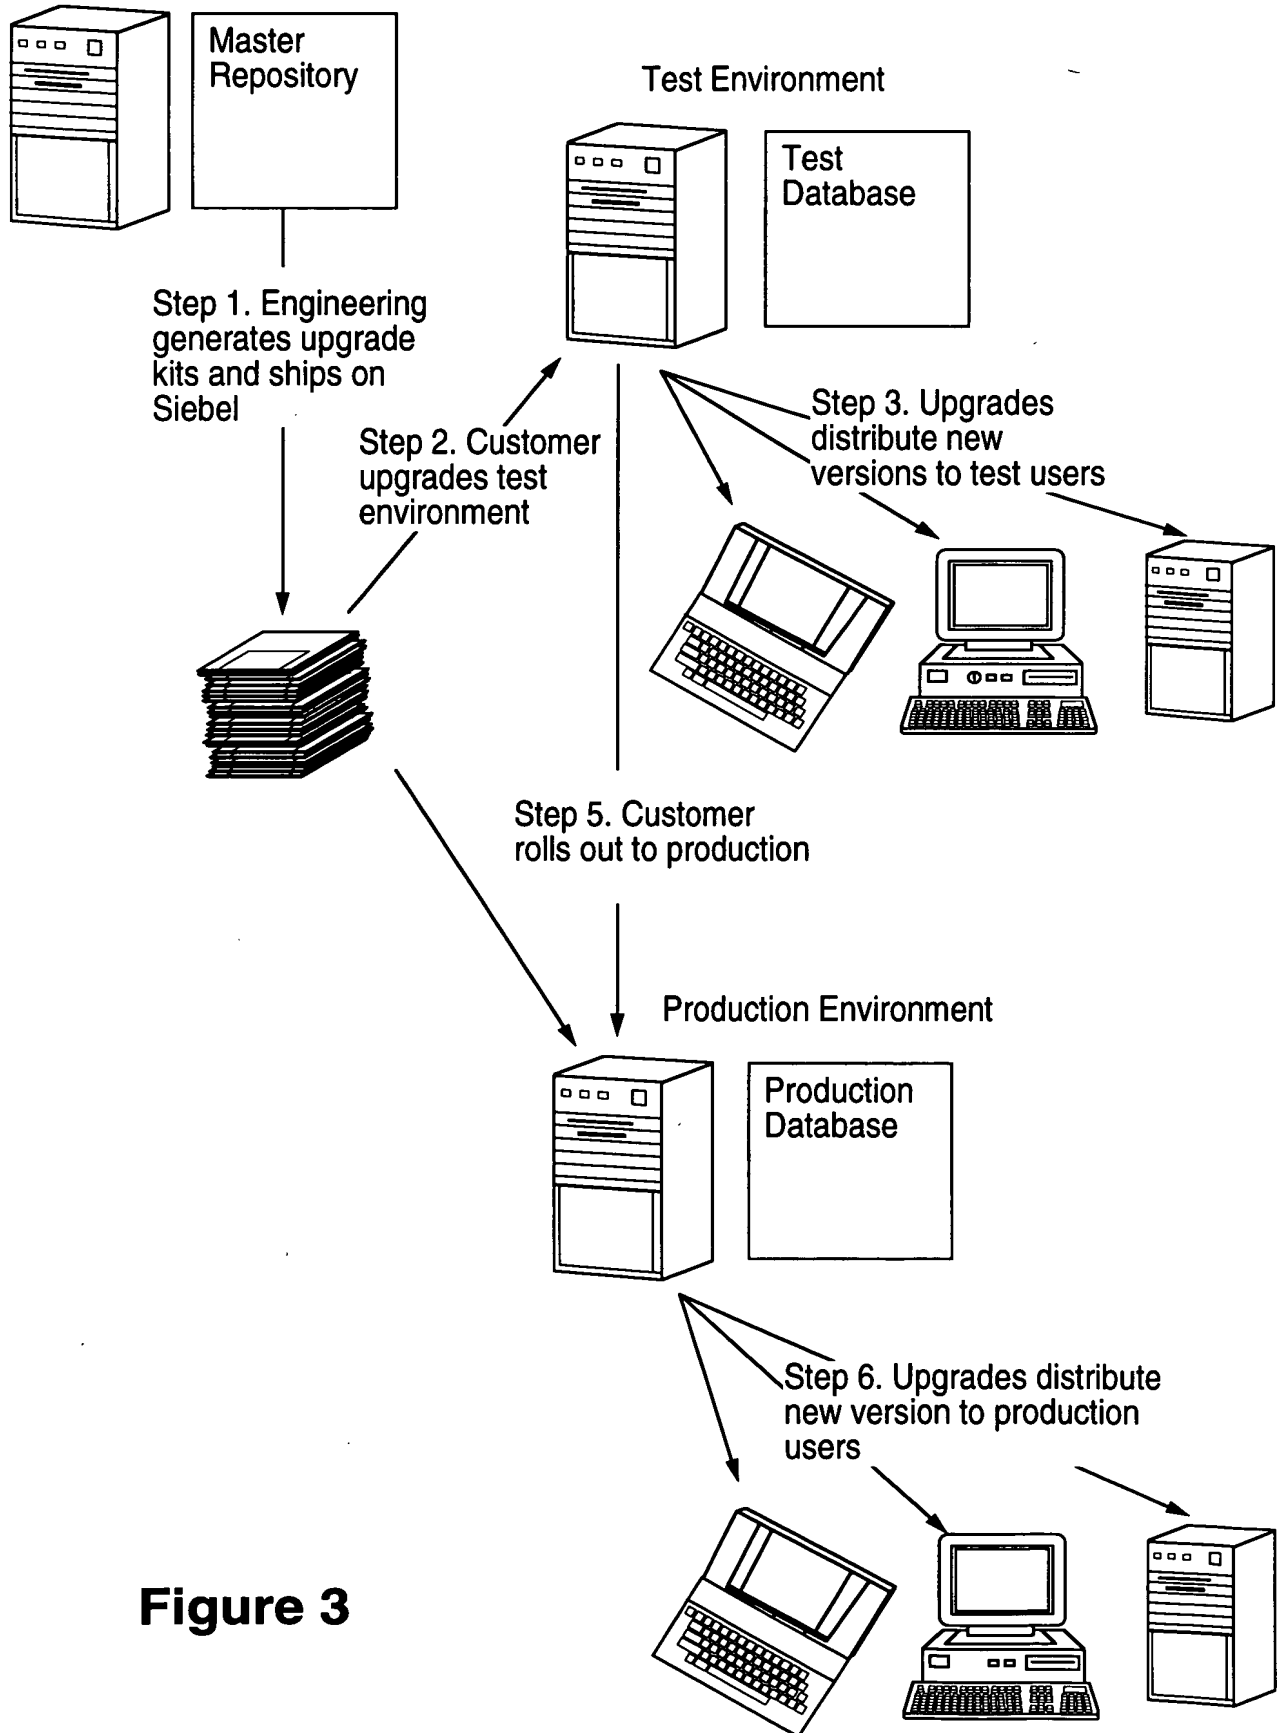

Mobile Users

Step 5. After each session, the Docking client compares required versions to local installed versions.

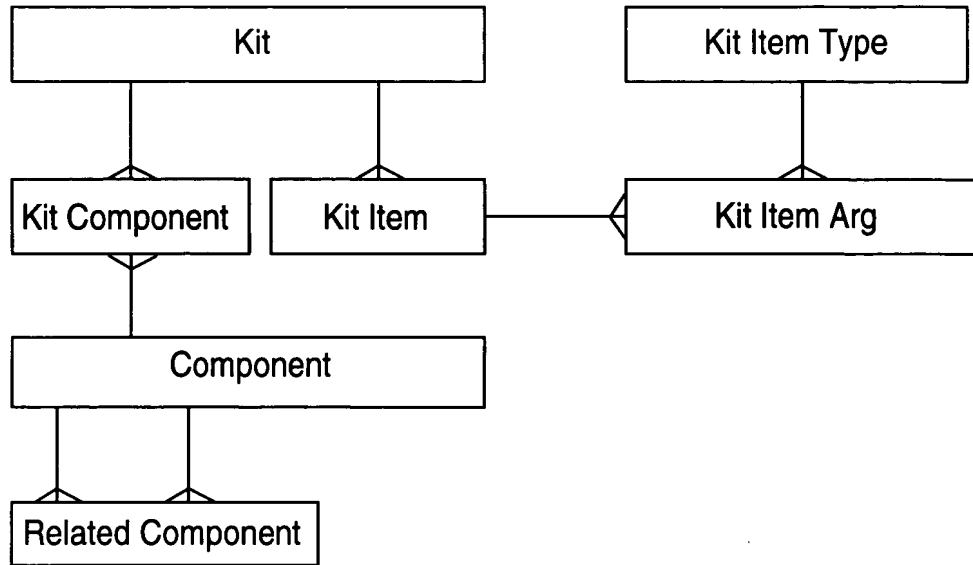

If an upgrade is required, the docking client retrieves the upgrade kit archive file from the file server and invokes the upgrade

3/4
